

Chapter 4. Angle Modulation

程序代写代做 CS编程辅导

Modulation: the process in which some characteristics of a carrier wave is varied in accordance with an information-bearing signal $m(t)$.

- **Carrier:** used to facilitate the transmission of messages, e.g., sinusoid waves.

WeChat: cstutorcs

Assignment (Project Exam Help)

Email: tutorcs@163.com

- **Amplitude modulation:** the amplitude A_c is varied in accordance with $m(t)$.

QQ: 749389476

- **Angle modulation:** the angle $2\pi f_c t + \theta$ is varied in accordance with $m(t)$.

4.1 Fundamental Theories of Angle Modulation

程序代写代做 CS编程辅导

- A sinusoidal carrier wave:

$$c(t) = A_c \cos(2\pi f_c t),$$

where f_c is the carrier frequency, A_c is the carrier amplitude.

- Message signal/information-bearing signal: $m(t)$

WeChat: cstutorcs

Angle-modulated wave: Assignment Project Exam Help

$$s(t) = A_c \cos[\theta_i(t)]$$

$\theta_i(t)$: angle of the modulated wave. Varies in accordance with the message signal $m(t)$.
Email: tutorcs@163.com
QQ: 749389476

If no message signal ($m(t) = 0$), $\theta_i(t) = 2\pi f_c t + \phi_c$.
<https://tutorcs.com>

Without loss of generality, ϕ_c is assumed to be 0.

Angle modulated signal:

程序代写代做 CS编程辅导

$$s(t) = A \cos[\theta_i(t)],$$

The angle $\theta_i(t)$ is a function of time and changes by 2π radians.

Instantaneous frequency of the modulated signal:

WeChat: cstutorcs

$$f_i(t) = \lim_{\Delta t \rightarrow 0} \frac{\theta_i(t + \Delta t) - \theta_i(t)}{2\pi \Delta t} = \frac{1}{2\pi} \frac{d\theta_i(t)}{dt}$$

rads/s

QQ: 749389476

That is: $\theta_i(t) = 2\pi \int_0^t f_i(\tau) d\tau$

<https://tutorcs.com>

Phase modulation (PM): the **angle** is varied linearly with the message signal $m(t)$ (k_p : the phase-sensitivity factor)

PM modulated wave

$$s(t) = A_c \cos[2\pi f_c t + k_p m(t)].$$

- Instantaneous phase: $\theta_i(t) = 2\pi f_c t + k_p m(t)$.

- Maximum phase deviation: $\Delta\theta_{\max} = k_p \max_t |m(t)|$.

- Instantaneous frequency: $f_i(t) = f_c + \frac{k_p}{2\pi} \frac{dm(t)}{dt}$.

- Maximum frequency deviation: $\Delta f_{\max} = \frac{k_p}{2\pi} \max_t \left| \frac{dm(t)}{dt} \right|$.

Frequency modulation (FM): the instantaneous frequency is varied linearly with the message signal $m(t)$ (k_f : the frequency-sensitivity)

程序代写代做 CS编程辅导

FM modulated wave

$$s(t) = A_c \cos \left[2\pi f_c t + 2\pi k_f \int_0^t m(\tau) d\tau \right]$$

WeChat: cstutorcs

- Instantaneous phase: $\theta_i(t) = 2\pi f_c t + 2\pi k_f \int_0^t m(\tau) d\tau$.
 - Maximum phase deviation: $\Delta\theta_{\max} = 2\pi k_f \max_t \left| \int_0^t m(\tau) \tau \right|$.
- Instantaneous frequency: $f_i(t) = f_c + k_f m(t)$.
 - Maximum frequency deviation: $\Delta f_{\max} = k_f \max_t |m(t)|$.

<https://tutorcs.com>

$$\text{FM: } f_i(t) = f_c + k_f m(t).$$

$$\text{PM: } f_i(t) = f_c + \frac{k_p}{2\pi} \frac{dm(t)}{dt}.$$

FIGURE 4.1 Illustration of AM, PM, and FM waves produced by a single tone. (a) Carrier wave. (b) Sinusoidal modulating signal. (c) Amplitude-modulated signal. (d) Phase-modulated signal. (e) Frequency modulated signal.

Example: Given frequency and phase modulations of rectangular messages in the figure, find f_c , k_f , and k_p .

程序代写代做 CS编程辅导

For FM signal:

$$s(t) = A_c \cos \left[2\pi f_c t + 2\pi k_f \int_0^t m(\tau) d\tau \right]$$

WeChat: cstutorcs

Assignment Project Exam Help

For PM signal:

Email: tutorcs@163.com

$$s(t) = A_c \cos[2\pi f_c t + k_p m(t)].$$

QQ: 749389476

<https://tutorcs.com>

Relationship between PM and FM

程序代写代做 CS编程辅导

An FM wave $s(t) = A_c \cos \left[2\pi f_c t + 2\pi k_f \int_0^t m(\tau) d\tau \right]$

- can be seen as a PM wave produced by the modulating message: $\int_0^t m(\tau) d\tau$, where $k_p = 2\pi k_f$.

WeChat: cstutorcs

A PM wave $s(t) = A_c \cos[2\pi f_c t + k_p m(t)]$

Assignment Project Exam Help

- can be seen as an FM wave produced by the modulating message: $\frac{dm(t)}{dt}$, where $k_f = k_p / (2\pi)$.

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

4.2 Properties of Angle Modulation

程序代写代做 CS编程辅导

1. Constant transmission rate

Amplitude of modulated wave is fixed: A_c

Average transmit power of modulated wave:

$$P_{Ave} = \frac{1}{2} A_c^2$$

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

2. Irregularity of zero-crossings.

For angle modulation, the message resides in the zero-crossings of the modulated wave.

QQ: 749389476

http://tutorcs.com

程序代写代做 CS编程辅导

3. Non-linear modulation process.

Violates the principle of superposition.

Difficult to analyze

4. Visualization difficulty of message waveform.

5. Tradeoff of transmission bandwidth and performance

Less sensitive to noise compared to AM,

but with increased bandwidth.

Offers a tradeoff.

4.3 Spectral Analysis of FM

FM is non-linear. How to conduct the spectral analysis?

Step 1: Consider single-tone modulation

Step 2: Gain insights for general case, and approximations are necessary.

Spectral analysis of single-tone modulation

Message signal:

$$m(t) = A_m \cos(2\pi f_m t)$$

FM wave:

$$s(t) = A_c \cos \left[2\pi f_c t + 2\pi k_f A_m \int_0^t \cos(2\pi f_m \tau) d\tau \right]$$

$$= A_c \cos \left[2\pi f_c t + \frac{2\pi k_f A_m}{f_m} \sin(2\pi f_m t) \right]$$

$$= A_c \cos[2\pi f_c t + \beta \sin(2\pi f_m t)]$$

where $\beta = \frac{\Delta f_{max}}{f_m} = \frac{k_f A_m}{f_m}$ is the FM modulation index.

Spectral analysis of single-tone modulation (continued)

Claim: in time domain, the single-tone FM modulated wave can be written as:

$$s(t) = A_c \sum_{n=-\infty}^{\infty} J_n(\beta) \exp[j(\omega_c + n\omega_m)t]$$

Where the nth order Bessel function of the first kind:

$$J_n(\beta) = \frac{1}{2\pi} \int_{-\pi}^{\pi} \exp[j(\beta \sin \alpha - n\alpha)] d\alpha$$

and $\sum_{n=-\infty}^{\infty} J_n^2(\beta) = 1$ for arbitrary β .

FIGURE 4.6 Plots of the Bessel function of the first kind, $J_n(\beta)$, for varying order

Frequency representation:

$$S(f) = \frac{1}{2} A_c \sum_{n=-\infty}^{\infty} J_n(\beta) [\delta(f - f_c - n f_m) + \delta(f + f_c + n f_m)]$$

Properties of the spectrum of single-tone FM wave:

$$S(f) = \frac{1}{2} A_c \sum_{n=-\infty}^{\infty} J_n(\beta) [\delta(f - f_c - n f_m) + \delta(f + f_c + n f_m)]$$

- 1. Infinite bandwidth:** the spectrum contains a carrier component and an infinite set of side frequencies located symmetrically on both sides of the carrier $\pm f_c$ at frequency separations of f_m .
[Email: tutorcs@163.com](mailto:tutorcs@163.com)
<https://tutorcs.com>
<https://tutorcs.com>
- 2.** The amplitude of the carrier component $\frac{1}{2} A_c J_0(\beta)$ varies with β .

<https://tutorcs.com>

3. Narrow-band FM ($\beta \ll 1$):

$$\begin{aligned}
 s(t) &= A_c \cos[2\pi f_c t + \beta \sin(2\pi f_m t)] \\
 &= A_c \cos(2\pi f_c t) \cos[\beta \sin(2\pi f_m t)] - A_c \sin(2\pi f_c t) \sin[\beta \sin(2\pi f_m t)] \\
 &\approx A_c \cos(2\pi f_c t) \cos[\pi f_m t] \sin(2\pi f_c t).
 \end{aligned}$$

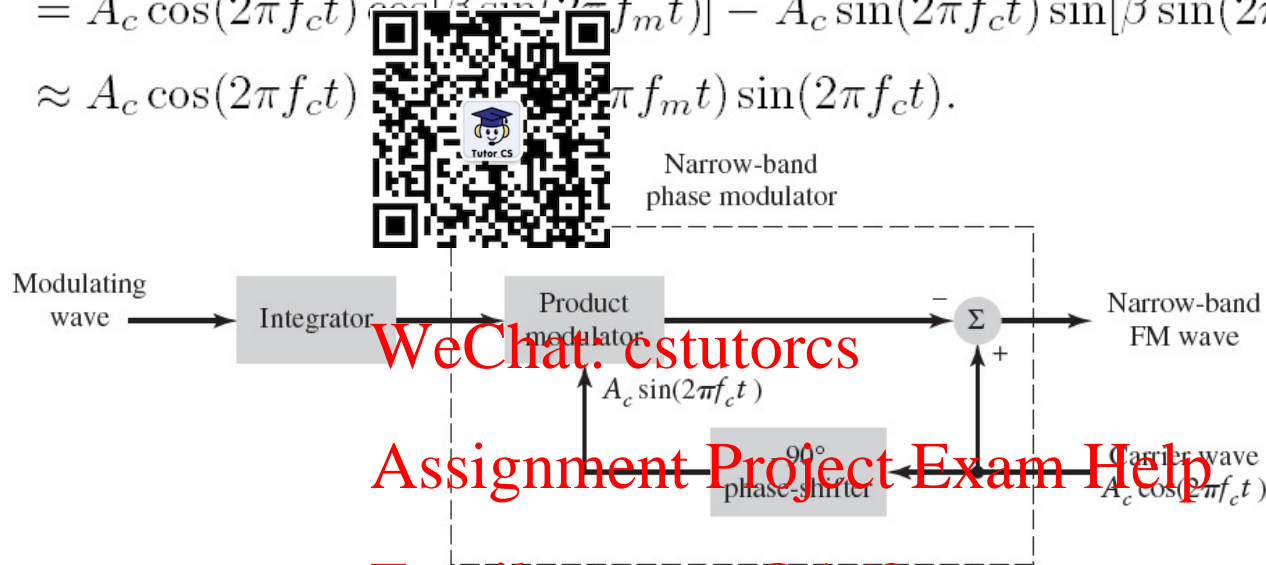

FIGURE 4.4 Block diagram of an indirect method for generating a narrow-band FM wave.

$$\begin{aligned}
 S(f) &= \frac{A_c}{2} [\delta(f - f_c) + \delta(f + f_c)] - \frac{\beta A_c}{4} [\delta(f - f_c + f_m) + \delta(f + f_c - f_m)] \\
 &\quad + \frac{\beta A_c}{4} [\delta(f - f_c - f_m) + \delta(f + f_c + f_m)]
 \end{aligned}$$

Narrow-band FM Bandwidth: approximately $2f_m$

Summary:

Strictly speaking, FM wave has infinite bandwidth.

In practice, FM wave is limited to a finite number of significant side-frequencies compatible with a specific amount of distortion.

程序代写代做 CS编程辅导

For single-tone FM wave,

Carson's rule (for both narrow-band FM and wideband FM) for the bandwidth of the modulated wave:

$$B_T \approx 2(\beta + 1)f_m = 2(k_f A_m + f_m) = 2\Delta f_{\max} \left(1 + \frac{1}{\beta}\right)$$

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

For PM, define the modulation index as

$$\beta = \Delta\theta_{\max} = k_p A_m$$

QQ: 749389476

<https://tutorcs.com>

The same result on bandwidth can be obtained.

程序代写代做 CS编程辅导

For the general case, define modulation index

$$\beta = \Delta\theta_{\max} |m(t)| \quad \text{for PM}$$

$$\beta = \frac{\Delta f_{\max}}{W} |m(t)| \quad \text{for FM}$$

where W is the message bandwidth.

Assignment Project Exam Help

Generalized Carson's rule for the bandwidth of angle modulated wave:

$$B_T \approx 2(\beta + 1)W$$

Email: tutorcs@163.com

QQ: 749389476

- Increase in the message amplitude increases the bandwidth.
- Increase in the message frequency increases the bandwidth.

<https://tutorcs.com>

Example: Given $m(t) = 10\text{sinc}(10^4 t)$. Determine the bandwidth of an FM-modulated signal with $k_f = 4000$.

<https://tutorcs.com>

4.4 Generation and Demodulation of FM

程序代写代做 CS编程辅导

Generation: Direct method

- Voltage-controlled oscillator: an sinusoidal oscillator which is directly modulated by the message signal.

Advantage: Direct and straightforward.

Can have large frequency deviations.

Disadvantage: Prone to frequency-drift (Requiring frequency stabilization circuit).

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

Generation: Indirect method.

First produce a narrow-band FM, which is followed by frequency multiplication to increase the frequency deviation to the desired level.

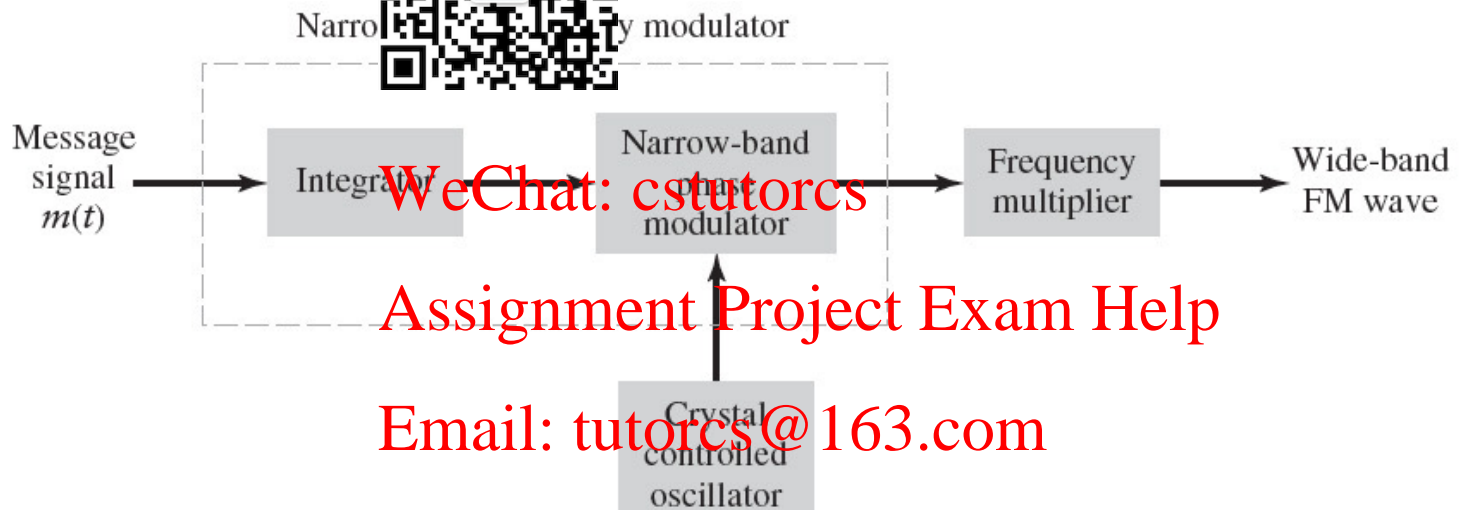

FIGURE 4.10 Block diagram of the indirect method of generating a wide-band FM wave.

Less prone to frequency-drift.

Frequency-multiplier

FIGURE 4.11 Block diagram of a frequency multiplier.

$$v(t) = a_1 s(t) + a_2 s^2(t) + \dots + a_n s^n(t).$$

$$s(t) = A_c \cos(2\pi f_c t + \theta(t)), \text{ where } \theta(t) = 2\pi k_f \int_0^t m(\tau) d\tau.$$

$$v(t) = a_1 A_c \cos(2\pi f_c t + \theta(t)) + \dots + a_n [A_c \cos(2\pi f_c t + \theta(t))]^n.$$

With large enough f_c , the term in $v(t)$ whose frequency is around nf_c takes the following form:

$$ca_n A_c^n \cos(2\pi n f_c t + n\theta(t))$$

This is also the output of the bandpass filter, i.e., the desired

FM wave. $s'(t) = A_c \cos \left[2\pi f'_c t + 2\pi k'_f \int_0^t m(\tau) d\tau \right]. \quad f'_c = n f_c, \quad k'_f = n k_f.$

Demodulation: To recover the message from the FM wave.

Frequency Discrimination

FM wave:

$$s(t) = A_c \cos \left[2\pi f_c t + 2\pi k_f \int_0^t m(\tau) d\tau \right]$$

$$\frac{ds(t)}{dt} = -2\pi A_c [f_c + k_f m(t)] \sin \left[2\pi f_c t + 2\pi k_f \int_0^t m(\tau) d\tau \right]$$

Envelope of $\frac{ds(t)}{dt}$: $2\pi A_c [f_c + k_f m(t)]$

After DC blocker and scaling, $m(t)$ is obtained.
