

## Solution to Homework Assignment 10

**Solution to Problem 1:** Following Nyquist Channel Theorem, the Nyquist bit rate for error-free communication is  $bitrate = 2B \log_2 M$ . From the problem,  $B = 1400\text{Hz}$  and  $bitrate \geq 9600$ . That is,

$$1400 \times \log_2 M \geq 9600$$

Hence, we have  $\log_2 M \geq 9600/4 = 2400$  bits/symbol. Let's use 4 bits to represent 1 symbol, then the symbol rate is  $9600/4 = 2400$  symbols/s. And, with a constellation size of  $2^M = 2^4 = 16$ .

**Solution to Problem 2:**

(a) There are 4 points with energy  $4A^2 + 4A^2 = 8A^2$ . Thus

$$E_A = \frac{1}{8} (4 \times 4A^2 + 4 \times 8A^2) = 6A^2.$$

The minimum distance is  $d_{\min} = 2A$ .

(b) There are multiple possibilities, one of which is shown in the following figure:

The minimum distance of this new constellation is also  $2A$ . There are 2 points with energy  $A^2$ , 2 points with energy  $3A^2$ , and 4 points with energy  $(2A)^2 + (\sqrt{3}A)^2 = 7A^2$ . The average transmit energy of the new constellation  $A'$  is thus

$$E_{A'} = \frac{1}{8} (2 \times A^2 + 2 \times 3A^2 + 4 \times 7A^2) = \frac{9}{2}A^2 < E_A.$$

The new design has smaller energy with the same minimum distance, thus better.

**Solution to Problem 3:**

(a) The minimum decision rule is

$$\hat{a} = \arg \min_{a \in \{-1, 1\}} |y - a|.$$

This is to check if  $y$  is closer to  $-1$  or  $1$ . Thus, the decision rule is:

$$\hat{a} = 1 \text{ if } y \geq 0 \text{ and } \hat{a} = -1 \text{ if } y < 0.$$

(b) When  $a = 1$ , error happens when  $\hat{a} = -1$ , which happens when  $y < 0$ . Thus

$$P_e|(a = 1) = P[y < 0|a = 1] = P[1 + n < 0] = P[n < -1] = Q(1/\sigma).$$
